TITLE: <sup>21, 44, 55</sup> Optic anisotropy of tetragonal single crystals of barium and lead titanates

SOURCE: Fizika tverdogo tela, v. 7, no. 12, 1965, 3657-3660

TOPIC TAGS: lead compound, titanate, barium titanate, crystal anisotropy, single crystal, double refraction, ferroelectric crystal, electrooptic effect

ABSTRACT: In view of the fact that earlier investigations have shown that the birefringence of BaTiO<sub>3</sub> and PbTiO<sub>3</sub> has theoretically a sign opposite that observed experimentally, and in view of the unsatisfactory explanation of this difference by W. Kinase et al. (Phys. Rev. v. 116, 348, 1959), the authors have recalculated the birefringence of BaTiO<sub>3</sub> and PbTiO<sub>3</sub> due to only the anisotropy of the internal

Card 1/2

ACC NR: AP6000876

fields, with exact account of the tetragonal nature of the unit cells. The calculations were performed with an electronic computer, with account of the tetragonality and displacement of the ions. The results yielded values of  $n_c - n_a = -0.018$  for  $BaTiO_2$  and  $n_c - n_a = -0.126$ , so that these single crystals are found to be optically negative, as confirmed by experiment, in contrast with the earlier calculations. However, the obtained values themselves differ considerably from the experimental values, the discrepancy being attributed to an incorrect choice of the polarizabilities. At any rate, it is concluded that the spontaneous electro-optical effects of ferroelectric single crystals, which is manifest in a change of the birefringence as a result of spontaneous polarization, is an inherent property of the structures of these crystals, and should not lead to a change in the sign of the birefringence. Authors thank V. Ya. Yershov for help in the calculations. Orig. art. has: 3 formulas and 2 tables.

Title : ...

Abstract : ...

Abstract : The qualitative change of water changes in reservoirs is limited by the influence on the feeding and respiration of fish during the winter because of changes in oxygen content. In comparing data for a number of years with varied water changes in the Yakhrum reservoir it was established that the nature of water changes in the fall-winter, as well as in the summer-fall seasons, may radically affect the winter activity of the reservoir. The necessity of maintaining water changes in artificial reservoirs is proved.

Meyster, L.A., and N.I. Saltykov

K istorii geokriologicheskikh issledovaniy v SSSR (On the History of Cryopedological Research in the USSR) Syktyvkar, Komi knizhnoye izd-vo, 1958. 82 p. Errata slip inserted. 1,500 copies printed.

Sponsoring Agency: Akademiya nauk SSSR. Institut merzlotovedeniya ime-ni V.A. Obrucheva.

Resp. Ed.: S.P. Kachurin, Candidate of Geographical Sciences;  
Resp. Ed. for this book: L.A. Brattsev; Tech. Ed.: I. Oplesnin.

PURPOSE: This book is intended for engineers and other specialists concerned with construction work and the exploitation of mineral and other resources in permafrost regions.

COVERAGE: This is a review of the development of cryogenic studies of permafrost phenomena and conditions in Russia during the Soviet period. Systematic studies began with the appearance of M.I. Sumgin's work, Vechnaya merzlota pochvy v predelakh SSSR, in 1927.

Card 1/3

On the History of Cryopedological Research (Cont.)

SOV/2074

Since then, extensive research on construction conditions, underground water, artificial defrosting, physicommechanical properties of frozen rock, the physical, physicommechanical, and physicochemical (particularly thermophysical) processes in soils and subsoils related to seasonal freezing, highway, railroad, airport and dam construction, mining, and pipe laying in the polar and subpolar areas, etc. has been conducted by numerous institutions and organizations. The following are the more important: Institut merzlotovedeniya; Section of Permafrost Studies; Department of Geology, Moscow State University imeni M.V. Lomonosov (established 1953); Department of Road Research, TsUMT (Central Administration of Local Transportation), Leningrad; GIPROMEZ (State Institute for the Design and Planning of Metallurgical Plants), Leningrad; Institute of Railroad Transportation Engineers, Moscow; Agricultural Academy imeni K.A. Timiryazev, Moscow; Amuro-Yakutskaya Highways Administration; Glavsevmorput'; the North-eastern Division of the Institute of Permafrost Research (formerly the Yakutsk Scientific Research Permafrost Station); Scientific Research Institute at Magadan (geocryological research); Chita Permafrost Station (1941-43); Aldan Permafrost Scientific Research Station of the Institute of Permafrost Research at Chul'man, Yakutskaya ASSR; LIKS (Leningrad Institute of Municipal

SOV/2074

Construction Engineers. Research was aided by permafrost stations at Skovorodino, Petrovsk-Zabaykal'sk, Anadyr', Igarka, Yakutsk, Vorkuta, Noril'sk, and Bratsk. Some of the more important scientists in this field are: M.I. Sumgin, V.I. Vernadskiy, P.I. Koslovskov, N.A. Tsitovich, S.P. Kachurin, N.I. Tolstikhin, V.F. Tumel', L.A. Bratsev, L.A. Yachevskiy, V.B. Shostakovk, M.N. Gold'shteyn, Ananyan, Razumov, Tyutyunov, Bakulin, and Pchelintsev. Their theories and contributions and those of many others are discussed by the author. Outstanding works in this field are Osnovaniya mekhaniki merzlykh gruntov, by N.A. Tsitovich and M.I. Sumgin; Obshcheye merzlotovedeniye, by M.I. Sumgin et al.; Ornovy geokriologii, published by the Institute for Permafrost Research. A geocryological map of the USSR, scale 1: 5,000,000, which reflects the effect of physico-geographic zonality and azonality of geological and hydrological conditions on the formation and distribution of frozen layers and the distribution of seasonally freezing soil and rocks is now being compiled; a similar map, scale 1:10,000,000 has already been published. There are 258 Soviet references.

✓ Investigation of contours of electronic absorption bands of liquid benzene and its solutions. V. M. Chulapovskii, T. G. MEYSTER and E. N. Strubenskaya. *Vestnik Leningrad. Univ.* 10, No. 2, Ser. Mat., Fiz. i Khim. No. 1, 143-7 (1955). -- The absorption bands of pure benzene in hexane and H<sub>2</sub>O soln. are complicated and asymmetrical in the interval of 2200-2700 Å. The absorption bands in the hexane soln. are narrow and displaced in the short-wave region. In the aq. soln. the contours of bands sharply change and be-

come symmetrical and are much more displaced in the short-wave region. The character of distribution of the intensity in bands and its half-width of C<sub>6</sub>H<sub>6</sub> soln. depends on the nature and the extent of action of the surrounding mol.

Title        : Study of the contour of electron absorption bands for liquid benzene and its solutions

Periodical   : Vest. Len. un. Ser. mat. fiz. khim. 10/2, 143-147, Feb 1955

Abstract    : The study of electron absorption spectra of benzene and its derivatives was carried out for the purpose of determining the intermolecular reactions occurring during electron excitation of the molecules. The effect of the solvents on the absorption band intensity is explained. Data are presented regarding the interaction between benzene molecules and the molecules of the solvent (water and hexane). MEYSTER, T. G.

Electronic absorption spectra of benzene and its solutions in ethanol and hexane. V. M. Chulanovskii, T. G. Meyster, and O. V. Sverdlova. *Vestnik Leningrad. Univ.* 10, No. 8, Ser. Mat. Fiz. i Khim. No. 3, 123-7(1956); cf. *C.A.* 49, 13776i.—The position and half-width of 2 benzene absorption bands ( $\nu_1 = 38,226$  and  $\nu_2 = 38,295$   $\text{cm}^{-1}$ ) were studied as a function of the concn. of benzene in two different types of solvent, EtOH and hexane. The concn. varied from 0.0013% to 100%. Both bands, in both solvents, show a gradual pos. peak-frequency shift up to a displacement of about 120  $\text{cm}^{-1}$  for concns. decreasing from 100% to about 5%. After this the position of both bands remains const. The half-width of  $\nu_1$  decreases by about 100  $\text{cm}^{-1}$ , and that of  $\nu_2$  decreases by about 80  $\text{cm}^{-1}$ , for both solvents, with the same concn. dependence as for the frequencies. These phenomena are explained on the basis of the vibrational structure of the electronic bands, by suggesting that the contour of the bands, in the main, is detd.

by the strong vibrational "breathing" frequencies of benzene. A variation in concn. effects a redistribution of vibrational transition probabilities, and thus a change in the band contours. Since the changes were approx. the same in both solvents, it is postulated that the greatest interactions giving rise to band contour changes take place between the excited and unexcited benzene mols., rather than between solvent mols. and benzene. This also explains the constancy of frequency and band width at the lower concns. For instance, the av. sepr. of benzene molecules at a 1% concn. is about 25 Å.

Molekularnaya spektroskopiya (Molecular Spectroscopy) [Leningrad] Izdat-vo Leningr. univ., 1960, 138 p., 4,700 copies printed.

Eng. Ed.: P. I. Skripov; Eds.: N. V. Shumakova and V. D. Plazov; Serb. Ed.: B. D. Vokzalica.

NOTE: This collection of articles is intended for scientific workers, instructors and students of physics and chemistry. It may also be used by engineers and technicians employing molecular spectroscopy.

CONTENTS: The collection of articles describes spectroscopic studies of liquids and solutions, and includes data on applied molecular spectroscopy. Individual articles deal with the molecular interaction in solutions, and specifically with the hydrogen bond problem. Works on the optimum utilization of spectral apparatus and on the analytical application of molecular spectroscopy are also included.

Aspects of the structure of high and low molecular compounds and of molecular complexes are also covered. The collection was published in honor of the 70th birthday of Professor Vladimir Mikheylovich Chukanovskiy, Soviet specialist in molecular spectroscopy and spectral analysis. There are no references.

TITLE: A device for saturating fibrous reinforcing materials with a binder. Class 39,  
 No. 175641

SOURCE: Byulleten' izobreteniy i tovarnykh znakov, no. 20, 1965, 63

TOPIC TAGS: bonding material, industrial instrument, mechanical motion instrument

ABSTRACT: This Author Certificate presents a device for saturating fibrous reinforcing materials with a binder. The device contains a mechanism for moving the material over a rigid base and a working percussion instrument. The latter is set into reciprocating motion in a plane normal to the motion of the material. To increase the productivity of the device while improving the saturation quality, the working instrument consists of spring-loaded plates mounted on a common traverse. Elastic supports are fixed to that side of the plates which is toward the material being worked.

TOPIC TAGS: laminated material, glass product, reinforced plastic

PURPOSE AND COVERAGE: The book presents data on production technology, methods for processing and use of laminated plastics. Basic attention is given to glass reinforced plastics and plastics used in building construction and electrical engineering, made of reinforced cotton and asbestos cloth and paper. The book describes methods of production and properties of laminated wood plastics of high strength, as well as decorative plastics made of paper and plywood, impregnated with synthetic resin solutions. The book is intended for engineers and technical personnel and designers in various branches of industry and construction, using laminated plastics.

TITLE:

Phosphonitryl chloride rubber

PERIODICAL:

Vysokomolekulyarnyye soedineniya, v. 3, no. 3, 1961, 414-419

TEXT: The aging of phosphonitryl chloride (PNC) rubber has already been repeatedly investigated, but, as remarked by N. L. Paddock (Ref. 7: Chem. and Ind., 1960, 91-92), it has not yet been fully cleared. It was therefore the purpose of the present work to investigate the aging and the stabilization of PNC rubber. First, the trimer  $(PNC)_3$  was synthesized from  $PCl_3$  and  $NH_4Cl$  purified by recrystallization and distillation, after which it was polymerized for 6 hr at  $320^\circ C$ . Experiments confirm the fact that  $HCl$  is liberated during aging, corresponding to an equation (reaction with the water of moist air with formation of P-O-P cross links) suggested by H. Specker (Ref. 6: Angew. Chem. 65, 299-303, 1953). The infrared spectroscopic analysis of the films of fresh and aged rubber

89990

Phosphonitryl chloride rubber

S/190/61/003/003/006/014  
B101/B204

applied to KBr by means of a UR-10 spectrograph confirms; 1) The occurrence of a band corresponding to the P-O-P bond during aging. 2) The decrease of the intensity of the P=N band and occurrence of NH bands as a result of destruction. Furthermore, a displacement of the P=N bands with increasing molecular weight from  $1340\text{ cm}^{-1}$  (molecular weight  $2.10^2$ ) to  $1360\text{ cm}^{-1}$  (molecular weight  $1.10^6$ ) was observed. Pycnometrically, an increase in specific weight (from 1.77 to 2.02) was found, which takes place within 8 days. By X-ray analysis, this effect could be explained as crystallization. Conforming with the data of the increase in specific weight, a duration of the crystallization of 170 hr was found. The melting point of the crystals was between  $30 - 40^\circ\text{C}$ . By weighing, the effect produced by aging upon weight was investigated. With 100% moisture, the increase in weight was 1.4% after 200 hr, and 7.9% after 300 hr. This change in weight, however, depended on the ratio between the cross section of the specimen and its surface. The authors found:  $y = (P - P_\tau)/P$

$= -0.111F - 0.794\delta + 1.22$  (4). Here, P is the initial weight,  $P_\tau$  after  $\tau$  hr, F the area of the cross section,  $\text{cm}^2$ ,  $\delta$  the thickness in mm. From this equation it follows that aging is a diffusion process proceeding from

X

the surface. 40 stabilizers were examined and the degree of stabilization K was determined:  $K = y_p / (y_p - y_{stab})$ , where  $y_p$  is the loss in weight of pure rubber according to Eq. (4), and  $y_{stab}$  is the loss in weight of stabilized rubber. Table 2 shows the results obtained by means of some stabilizers. There are 5 figures, 2 tables, and 11 references: 1 Soviet-bloc and 10 non-Soviet-bloc. The 1 reference to English-language publication is given in the text of the abstract.

AUTHOR: Meytin, Yu. V.

TITLE: Methods for determining the hydrophobic properties of glass fabrics <sup>15</sup> B

SOURCE: Plasticheskiye massy\*, no. 12, 1964, 48-53

TOPIC TAGS: glass cloth, hydrophobicity, glass fiber, finishing agents, wetting test

... immersion in distilled water at a controlled temperature of 25.0C. The usual im-  
mersion time is 3 hrs, but as little as 10 minutes may be required for hydrophilic glass  
fiber. The amount of water, usually 500 ml, should be reduced or increased with fibers  
of low or high air content, respectively, and an equation is derived for calculating the  
volume of water from the initial rates of air desorption. The study proved that hydrophobic  
properties are produced by the finishing agents vinyltri (ethoxyethoxy) silane (GVS-9), <sup>15</sup>  
vinyltriethoxysilane (VTES) and by an emulsion of ethylhydrosiloxane (GKZh-94) recom-  
mended as fillers of polyesters; hydrophilic surfaces are produced, however, by finishing

TITLE: Glass textolite ST based on sized glass cloth

SOURCE: Plasticheskiye massy, no. 10, 1965, 59-63

TOPIC TAGS: glass textolite, glass cloth, fiberglass, electric property, dielectric permeability, electric resistance, phenolformaldehyde, specialized coating, organometallic compound, silane, heat property

ABSTRACT: The moisture resistance and electrical properties of glass textolite ST based on phenol-formaldehyde resin IF and made of glass cloth treated with different sizings were studied to help in selection of materials with optimum properties. The electrical and physical-mechanical properties of the textolite based on sized glass cloth are much better than those of standard glass textolite; the electrical properties compare with those of glass textolite ST containing polyphenylsiloxane. Glass cloth E and SE was sized with the following materials:

gamma-aminopropyltriethoxysilane AGM-9, a chromium complex of methacrylic acid--Volan 702, ethylhydroxysiloxane liquid GKZh94, polymethylsilazane GKZh16, polydimethylsilazane L-24k, aminosilanes ADE-3 and ADER-2, vinyl-triethoxysilane VTES, and a phenylethoxysilane hydrolysis product--resin F-9. The first four sizings imparted good electrical properties after prolonged soaking in water or in 95% humidity at 20 C. The effectiveness of GKZh94 and GKZh16 was reduced with increased temperature. Procedures were worked out for the thermo-chemical treatment of glass cloth with Volan 702 or with AGM-9 to insure obtaining textolite with high electrical properties under high humidity conditions. TITLE: ~~Acidifying of Wells in the Petroleum Organization of~~  
Stalinneft' (Kislotnyye obrabotki skvazhin v neftepromy-  
slovom upravlenii Stalinneft')

PERIODICAL: Novosti neft. tekhniki. Neftepromysl. delo, 1956, Nr 5,  
pp 18-20

ABSTRACT: Examining the effectiveness of acidization in the well-  
bottom zone of oil wells, in order to increase yield,  
the author cites numerous examples in support of the  
advantage of this method. At the same time, he re-exa-  
mines a number of factors which have a negative influ-  
ence on the effectiveness of acidization. A brief  
description is given of experiments to treat the well-  
bottom zone with hydrochloric acid, to which acetic and  
hydrofluoric acid have been added. The author describes

Acidifying of Wells in the Petroleum (Cont.)

the sequence of operations in acidizing wells and expresses the opinion that it is necessary to improve the techniques of this treatment.

3817. Changes in the saturation of arterial blood with oxygen in patients at the time of operations on the heart and large blood vessels. R. A. Meytina, *Khirurgiya*, 1955, No. 8, 33-37; *Referat. Zh. Biol.* 1956, Abstr. No. 73813. - With the help of the catheter oximeter the  $O_2$  satn. of the blood in 33 patients was investigated at the time of the operation. When the operation is proceeding favourably the satn. shows an initial lowering at the time of intubation and a second lowering at the time of separation and clamping of the large vessels. After making the anastomoses and removal of the clamps the  $O_2$  satn. of blood rises above its initial level. A steady fall in satn. is a signal for taking urgent measures to prevent inhibitory insufficiency. (Russian) D. H. SMYTH
